FedCast

A forecaster for the next Federal Reserve rate decision, built to be judged by its process rather than its luck

Tan Kah Ming · Fullerton · October 2026

About me

Tan Kah Ming

Senior AI, Data and Technology Consultant, seconded to Temasek Holdings, Digital Innovation (2023 to now)

Before that

- Data scientist, RSAF Data Office: authored the Air Force's AI strategy, set up its first digital unit
- Air engineering and weapons logistics officer, where the data-driven habit started (Weibull analysis, predictive maintenance)

Training

M.Eng Aeronautical Engineering, Imperial College London · Graduate Certificate in Predictive Analytics, NUS · CFA Level 3 candidate (February 2027)

Things I have built that models had to earn trust in

1

Investment analytics at Temasek

An AI-assisted analyst performance and attribution platform for 50+ investment professionals, with an LLM signal tracker for high-conviction ideas; signal cadence moved from monthly to daily, every recommendation logged in real time.

2

Valuation and execution

A machine-learning mark-to-market for private holdings, systematic and reproducible; and an AI-driven order management system on AWS processing about S$30m a day, replacing an email-based workflow.

3

Forecasting under a scoreboard

4th of 160+ teams (MIT, DoD, USAF) in the 2023 USAF AI Accelerator, predicting pilot flying difficulty from physiology; an ammunition recommender (quantile LightGBM) that cut wastage with no shortfall, Defence Manpower Committee Innovation Award 2022.

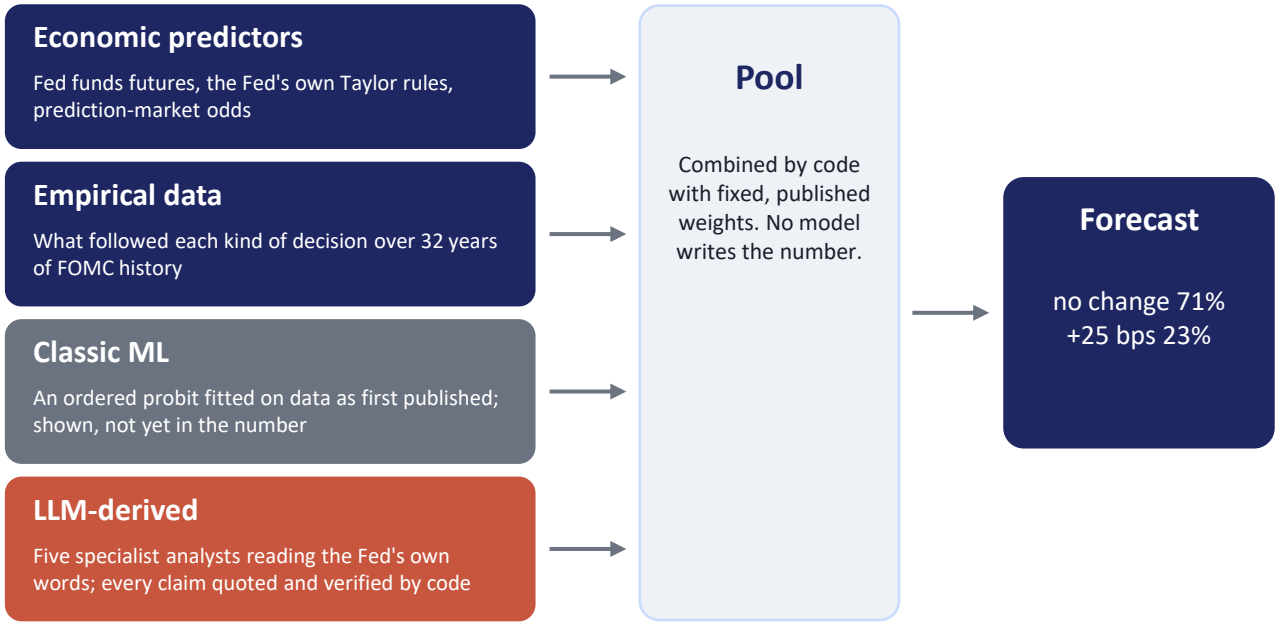

4

COVID-19, 2021

Built, in weeks, the system that engaged every home-recovery patient in Singapore, 10,000 people a day, on form.sg, Azure and Zendesk. The lesson that carries over: a system people rely on must say what it knows and what it does not.

What FedCast is, and why we built it

A forecast of the next FOMC decision as probabilities over five outcomes, from one frozen snapshot of evidence. Today, for 28 October 2026: no change 71%, +25 bps 23%.

What it does

- Freezes one fingerprinted snapshot of evidence per forecast; nothing outside it may be read.
- Enforces repeatability: five identical runs per analyst, tools off, every quote checked by code, a pre-registered scorecard on every snapshot.
- Offers typed channels for human judgement (views, watch-outs, documents, odds): bounded, recorded, scored afterwards. None active today.
- Keeps every snapshot and forecast in a hash-chained ledger, so the number's path can be read back as information arrived.

Why we built it

1 Fed prediction tools are judged on outcomes, which cannot be repeated

There are many of them. Eight decisions a year make a hit rate neither predictable nor repeatable as a measure of a tool. We judge ours on a pre-registered process: is the same answer produced from the same evidence, can every claim be traced, does a shock move the number the right way.

2 Most lean too far one way

Either empirical formulas and market prices alone, or everything thrown at a language model. Ours harmonises the three: empirical data, classic ML and a harnessed LLM, each with a stated role and a stated weight, combined by code.

3 What that buys

Auditability: every input visible, every forecast replayable. Evidence-based: every claim quoted and verified, nothing from memory. A harnessed LLM that cannot give random or spurious answers, and a naive LLM kept as the control that shows what the harness adds. Users can study how one piece of evidence moves the decision. The model can be scrutinised and improved, rather than hoping the LLM works.
