# FedCast

A forecaster for the next Federal Reserve rate decision, built to be judged by its process rather than its luck

Tan Kah Ming · Fullerton · October 2026

# About me

## Tan Kah Ming

Senior AI, Data and Technology Consultant, seconded to Temasek Holdings, Digital Innovation (2023 to now)

### Before that

- Data scientist, RSAF Data Office: authored the Air Force's AI strategy, set up its first digital unit
- Air engineering and weapons logistics officer, where the data-driven habit started (Weibull analysis, predictive maintenance)

### Training

M.Eng Aeronautical Engineering, Imperial College London · Graduate Certificate in Predictive Analytics, NUS · CFA Level 3 candidate (February 2027)

## Things I have built that models had to earn trust in

1

### Investment analytics at Temasek

An AI-assisted analyst performance and attribution platform for 50+ investment professionals, with an LLM signal tracker for high-conviction ideas; signal cadence moved from monthly to daily, every recommendation logged in real time.

2

### Valuation and execution

A machine-learning mark-to-market for private holdings, systematic and reproducible; and an AI-driven order management system on AWS processing about S$30m a day, replacing an email-based workflow.

3

### Forecasting under a scoreboard

4th of 160+ teams (MIT, DoD, USAF) in the 2023 USAF AI Accelerator, predicting pilot flying difficulty from physiology; an ammunition recommender (quantile LightGBM) that cut wastage with no shortfall, Defence Manpower Committee Innovation Award 2022.

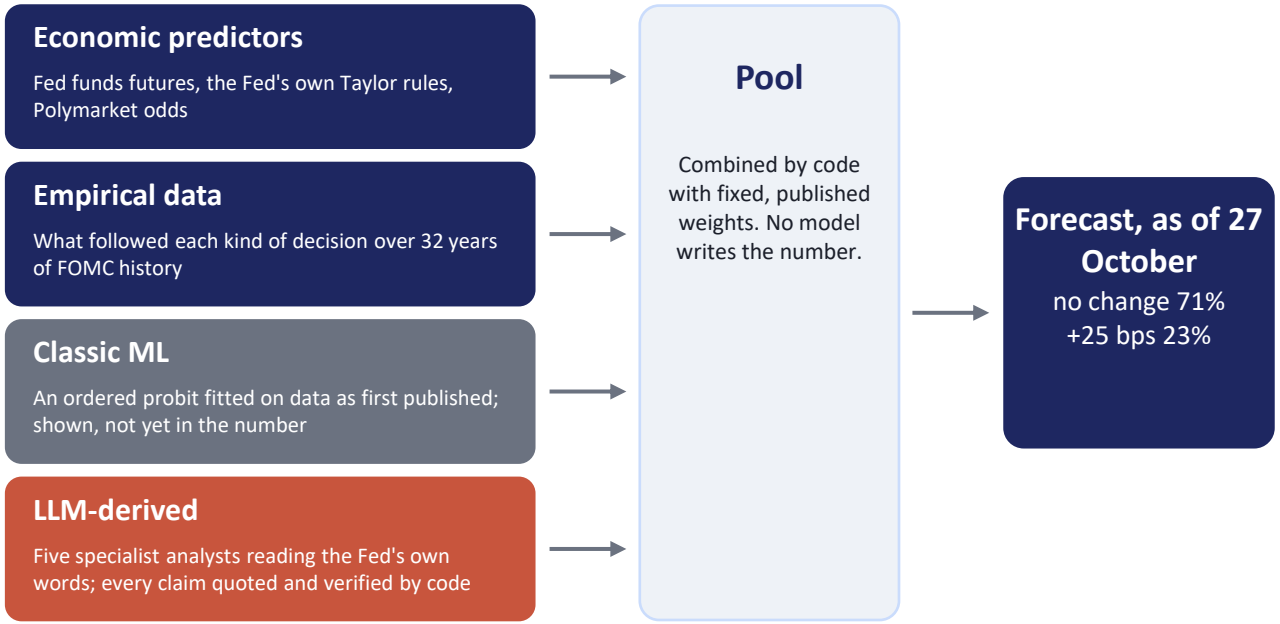

4

### COVID-19, 2021

Built, in weeks, the system that engaged every home-recovery patient in Singapore, 10,000 people a day, on form.sg, Azure and Zendesk. The lesson that carries over: a system people rely on must say what it knows and what it does not.

# What FedCast is, and why we built it

A forecast of the next FOMC decision as probabilities over five outcomes, from one frozen snapshot of evidence.
As of 27 October, for 28 October 2026: no change 71%, +25 bps 23%.

## What it does

- **Auditable by construction.** Every analyst claim carries a verbatim quote and its source item; code matches the quote and flags any number not in the evidence. Every forecast is frozen with its snapshot in a hash-chained ledger and recomputes exactly.
- **The LLM is harnessed, then laddered.** Tools off, one slice of evidence, a fixed answer shape, five identical runs. The same model also runs with no harness, with evidence only and with structure only, so each technique's value is measured on a pre-registered scorecard.
- **Human judgement through typed channels.** Views tilt the number by a capped amount and expire; watch-outs must be answered by every analyst; documents and odds enter as evidence. All recorded and scored afterwards. None active today.
- **A working tool.** A local app: pull evidence, run the forecast, read each analyst's claims, check the scorecard, score the decision once known. Runs anywhere from the repository.

## Why we built it

### 1 Fed prediction tools are judged on outcomes, which cannot be repeated

Many Fed tools exist. With only eight decisions a year, a hit rate cannot separate luck from skill, and next year is a different draw. **We believe a robust process requires repeatability.**
So we judge ours on a pre-registered process: does the same evidence give the same answer, can every claim be traced, does a shock move the number the right way.

### 2 Most lean too far one way

Either empirical formulas and market prices alone, or everything thrown at a language model. Ours combines the three: **empirical data**, **classic ML** and a **harnessed LLM**, each with a stated role and a stated weight, combined by code.

### 3 What that gives you

**A number you can challenge:** when it moves, you can see which input moved it, and by how much.
**Nothing from memory:** every claim traces to frozen evidence.
**Proof of what the harness adds,** from the naive control.
**A model that can be scrutinised and improved,** instead of hoping the LLM works.
**A record that starts this week:** the first live decision is scored.
